Pressure switch
Type HEDE10.../2/

Operating instructions
1 Overview of menu
2 Safety note
Read this product description before commissioning the device. Make sure that the product is suitable for the relevant application (sg) without any restrictions. The non-observance of notes on the operation or technical information can result in damage to property and/or personal injury. Verify for all applications the compatibility of the product materials (see Technical data) with the pressure media to be measured.

3 Operating and indicator elements

<table>

<td>Mode / Enter key</td>
</tr>
</tbody>
</table>
4 Proper use

- The pressure sensor senses the system pressure in hydraulic installations,
- shows it on a display
- and generates 2 output signals according to the set output configuration.

<table>

<td>800 bar</td>
<td>1200 bar</td>
</tr>
</tbody>
</table>

Avoid steady-state and dynamic overpressures that exceed the specified measuring range.

The device can be destroyed, when the specified overload pressure is exceeded only briefly.

Reaching the burst pressure represents a risk of personal injury.
High-pressure components (400 bar, 600 bar) are provided with an integrated throttle feature in order to prevent the risk of personal injury in case of bursting when the burst pressure is exceeded and in order to comply with the regulations for UL approval.

If the throttle feature is removed:

- the device can no longer be used in accordance with UL regulations,
- the throttle feature can be rendered inoperable.

Should you have any queries, please contact Bosch Rexroth.

5 Operating modes

5.1 Run mode

(Normal operating mode)

Following the application of the supply voltage, the device is ready for operation after 0.3 s and is then in the run mode. It performs its monitoring function and issues output signals according to the set parameters. The display shows the current system pressure and the yellow LEDs signal the switching status of the outputs.

5.2 Display mode

(Indication of parameters and set parameter values)

To switch the device over to the display mode, briefly press the “Mode/Enter“ key. Internally, it remains in the run mode. The set parameter values can then be read independently of this:

- To scroll through the parameters, briefly press the “Mode/Enter“ key.
• When you briefly press the “Set” key, the associated parameter value is displayed for 15 s. After further 15 s, the device returns to the run mode.

5.3 Programming mode
(Adjustment of parameter values)
The device changes over to the programming mode when a parameter is selected and then the “Set” key pressed for longer than 5 s (the parameter value flashes on the display and is then continuously increased). The device remains in the run mode also in this case. It continues to perform its monitoring functions with the set parameters until the change of parameters is completed. You can change the parameter value with the help of the “Set” key and confirm the setting by pressing the “Mode/Enter” key. The device returns to the run mode when no key is pressed for 15 s.

6 Installation

⚠️ Before installing or removing the sensors, make sure that the system is depressurized.
Install the pressure sensor at a G¹/₄ process port with a screwed plug according to DIN 3852-A-G ¹/₄.
The tightening torque is 25 Nm ± 20 %
7 Electrical connection

⚠️ The device may be installed exclusively by an electrical specialist.

Please observe the national and international regulations for the installation of electrotechnical systems.

Voltage supply according to EN50178, SELV, PELV.

For applications, for which an UL approval is required, the device shall be supplied from an isolating transformer having a secondary Listed fuse rated as noted in the following table.

<table>
<thead>
<tr>
<th>Control-circuit wire size</th>
<th>Maximum protective device rating in Ampere</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWG</td>
<td>(mm²)</td>
</tr>
<tr>
<td>26</td>
<td>(0.13)</td>
</tr>
<tr>
<td>24</td>
<td>(0.20)</td>
</tr>
<tr>
<td>22</td>
<td>(0.32)</td>
</tr>
<tr>
<td>20</td>
<td>(0.52)</td>
</tr>
<tr>
<td>18</td>
<td>(0.82)</td>
</tr>
<tr>
<td>16</td>
<td>(1.3)</td>
</tr>
</tbody>
</table>

The Sensor shall be connected only by using any R/C (CYJV2) cord, having suitable ratings.

Disconnect the system from the power supply and connect the device as follows:
### Colors of conductors for Bosch Rexroth plug-in connectors:

1 = BN (brown)  
2 = WH (white)  
3 = BU (blue),  
4 = BK (black)

### Pin assignments:

- Pin 4 (OUT1) = switching output
- Pin 2 (OUT2) = switching output, when OU2 = Hno, Hnc, Fno, Fnc
- Pin 2 (OUT2) = diagnosis output, when OU2 = dESI
## 8 Programming

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Press the Mode/Enter key until the <strong>desired parameter</strong> is shown on the display.</td>
</tr>
<tr>
<td>2</td>
<td>Press and hold the <strong>Set</strong> key. The <strong>current parameter value flashes</strong> on the display for 5 s, then it is <strong>increased</strong> (stepwise when pressing the key repeatedly or continuously by holding the key depressed).</td>
</tr>
<tr>
<td>3</td>
<td>Briefly press the Mode/Enter key (= acknowledgement). The parameter is displayed again, the new <strong>parameter value becomes effective</strong>.</td>
</tr>
<tr>
<td>4</td>
<td><strong>To change further parameters:</strong> Start again with step 1. <strong>Complete programming:</strong> Wait for 15 s or press the Mode/Enter key until the current measured value is displayed again.</td>
</tr>
</tbody>
</table>
*Reducing the value: Let the display run up to the maximum setting. Then, the cycle restarts with the minimum setting.

Set the displayed unit (Uni) before you determine the switching limits (SP1, rP1). In this way you can prevent rounding errors in the internal recalculation to other units and obtain exactly the required values. Factory setting: Uni = bar.

If no key is pressed for 15 s during the adjustment procedure, the device changes back to the run mode with unchanged values.

The device can be electronically interlocked so that unintended, incorrect entries can be avoided: Press both adjustment keys in the run mode until “Loc” is displayed. For unlocking, press the keys until “uLoc” is shown.

Factory setting: Not locked.

When the device is locked, “Loc“ is briefly shown on the display when you attempt to change the parameter values.

9 Commissioning / operation

After installation, electrical connection and programming are completed, check that the devices operates safely.

Fault messages during operation:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OL</td>
<td>Overload pressure (= measuring range exceeded)</td>
</tr>
<tr>
<td>UL</td>
<td>Underload pressure (= below measuring range)</td>
</tr>
<tr>
<td>SC 1</td>
<td>Flashing: Short-circuit in switching output 1 *</td>
</tr>
<tr>
<td>SC 2</td>
<td>Flashing: Short-circuit in switching output 2 *</td>
</tr>
<tr>
<td>SC</td>
<td>Flashing: Short-circuit in both switching outputs. *</td>
</tr>
<tr>
<td>-----</td>
<td>---------------------------------------------------</td>
</tr>
<tr>
<td>Err</td>
<td>Flashing: Internal fault *</td>
</tr>
</tbody>
</table>

* The relevant output is switched off as long as the short-circuit is present. These signals are also given when the display is switched off.

**Diagnosis function**
(in line with DESINA specifications)

Output 2 is used as diagnosis output, if $OU2 = dESI$.
- When no fault is present, the output is closed and carries $UB^+$ (when $P-n = PnP$) or $UB^-$ (when $P-n = nPn$)
- In the case of malfunction, the output becomes inactive. The following malfunction is acquired:

  Measuring cell defective; short-circuit in output 1; measuring range exceeded in either direction; EEPROM error; RAM error; processor fault.
10 Technical information / operating principle / parameters

10.1 Adjustable parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **SP1**  | Switching point 1 / 2  
Upper limit value, at which the output changes its switching status.  
Adjustment range: See Technical data.  
SP2 is only active, when \( OU2 = Hno, Hnc, Fno \) or \( Fnc \). |
| **SP2**  |  |
| **rP1**  | Switch-back position 1 / 2  
Lower limit value, at which the output changes its switching status.  
rPx is always smaller than SPx. Only values can be entered that are lower than the value of SPx.  
When the switching point is changed, the switch-back point is adjusted as well (the difference between SPx and rPx1 remains constant). If the difference is greater than the new switching point, it is automatically reduced (rPx is set to the minimum setting).  
Adjustment range: See Technical data.  
rP2 is only active, when \( OU2 = Hno, Hnc, Fno \) or \( Fnc \). |
| **rP2**  |  |
| **OU1**  | Configuration of output 1  
4 switching functions can be adjusted:  
- **Hno** = Hysteresis function / normally open (NO)  
- **Hnc** = Hysteresis function / normally closed (NC)  
- **Fno** = Window function / normally open (NO)  
- **Fnc** = Window function / normally closed (NC) |
### Configuration of output 2

4 switching functions can be adjusted:

- **Hno** = Hysteresis function / normally open (NO)
- **Hnc** = Hysteresis function / normally closed (NC)
- **Fno** = Window function / normally open (NO)
- **Fnc** = Window function / normally closed (NC)
- **dESI** = output 2 is used as diagnosis output

### Extended functions

This menu item includes a sub-menu with further parameters. To access these parameters, briefly press the “Set” key.

If access is protected by means of an access code, “Cod1” flashes on the display.

- Press the “Set” key and hold it down until the valid code no. is shown.
- Then, briefly press the “Mode/Enter” key.

Factory setting without access restriction

### Displayed unit

Measured values and values for SPx, rPx can be displayed in the following units:

- **bAr** (= bar), **PSI**, **PA** (= MPa).

Set the displayed unit **before** you determine the switching limits (SPx, rPx). In this way you can prevent rounding errors in the internal recalculation to other units and obtain exactly the required values.

Factory setting: **Uni** = **bAr**.
<table>

<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dAP</th>
<th>Attenuation for outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>This function can be used to filter out brief pressure peaks or high-frequency pressure peaks. dAP value = response time between the change in pressure and change in the switching status in milliseconds (ms).</td>
<td></td>
</tr>
<tr>
<td>The following, fixed values can be set; they determine the switching frequency (f) of the output:</td>
<td></td>
</tr>
<tr>
<td>dAP 3 6 10 17 30 60 125 250 500</td>
<td></td>
</tr>
<tr>
<td>f [Hz] 170 80 50 30 16 8 4 2 1</td>
<td></td>
</tr>
</tbody>
</table>
### Setting of the display

7 settings can be selected.

- **d1** = measured values are updated every 50 ms.
- **d2** = measured values are updated every 200 ms.
- **d3** = measured values are updated every 600 ms.

The update of measured values only refers to the display. It has no effect on the outputs.

- **rd1, rd2, rd3** = indication as with d1, d2, d3; but rotated by 180°.
- **OFF** = the indication of measured values is switched off in the run mode.

When you press one of the keys, the current measured values is displayed for 15 s. Repeated pressing of the Mode/Enter key opens the display mode. The LEDs remain active even when the display is switched off.

---

### 11 Hysteresis function / window function

#### 11.1 Hysteresis function

The hysteresis function maintains the switching status of the output stable when the system pressure fluctuates around the command value.

When the system pressure increases, the output switches when the switching point (SP1) is reached; when the system pressure falls again, the output only switches back when the switch-back point (rP1) is reached. The hysteresis can be adjusted: First determine the switching point, then the switch-back point with the required difference.
11.2 Window function

The window function allows monitoring of a defined “good“ range. When the system pressure lies between switching point (SP1) and switch-back point (rP1), the output is closed (window function / normally open contact) or opened (window function / normally closed contact). The width of the window can be adjusted by determining the difference of SP1 to rP1. SP1 = upper value, rP1 = lower value.
